FLEXIM® adhesive mortar has incredible sticking power

Since its introduction on the European market in 1984, FLEXIM® adhesive mortar has built a strong reputation throughout the world where it has been used on over two million buildings. Largely considered a breakthrough on the international market, FLEXIM received the Innovation Award in 1990.

The product can be used in new constructions, re-roofing, repairs and sealing on concrete, clay and other types of tile, including slate. It is instantly waterproof and being lightweight and pliable it retains its shape, will not crack, break or slump like conventional cement based mortars.

This innovative mortar's main application is to adhere and seal all perimeters on concrete, clay and slate roofs. However, FLEXIM can be used for instant repairs as well, for example, holding loose tiles in position – see photograph. Using the mortar, attaching new ridge and hip tiles securely to old roofs is no longer a time consuming problem. The manufacture claims, closing and waterproofing valleys with FLEXIM can achieved in minutes.

The products incredible bonding strength and resistance against the elements has been proven in several tests performed by highly recognised test institutes in Europe and the US. Adhesion and elasticity tests, which included intensive weathering trials where conducted using several kinds of tile. FLEXIM has successfully passed the US Metro-Dade PA 100-95 protocol a wind driven rain test with simulated 178 km/h (110 MPH) winds! In the report (TNO Holland) it has been found, that the tensile strength is 20.000 N/m². This complies with NEN 6707/Bb.

One box of FLEXIM contains ten ready-to-use strips with a total length of approximately 5 metres (17 linear feet). The coverage of one box depends on the profile of the tile - ranging from 3 to 5 metres (20 to 44 linear feet, single sided). Flexim is available in Black, Red/Terracotta, Grey, Dark and Light Brown,
